PROFILE

I'm a software engineer with experience building and maintaining distributed microservices using Go, TypeScript, and Java. At Atlassian, I worked on the Admin Experience team improving high-traffic backend endpoints, and at Qlik, I built and maintained services supporting data analytics and AutoML products.

EXPERIENCE

Software Engineer, Atlassian (Admin Experience team)  2025 – Aug 2026

- Reduced latency on a high-traffic API endpoint handling millions of requests per day by replacing a fan-out of downstream API calls with a single consolidated request.
- Investigated an SLO breach using SignalFX, Splunk, and Sentry, tracing the issue across the stack and ultimately identifying a frontend bug impacting service reliability.
- Reduced integration test flakiness from roughly 50% to 10% and cut CI runtime from 8 to 6 minutes by parallelizing tests in Bitbucket Pipelines, reducing reruns and speeding up developer feedback.
- Configured an AI-powered pull request review automation to flag coding-standard violations, obvious bugs, and common review issues, reducing manual review effort for contributions from outside the team.
- Enabled data sharding for a downstream service by auditing all call sites, determining how to derive the required shard context, and updating requests to include the appropriate routing header.

Software Engineer, Qlik (Qlik Predict)  2024 – 2025

- Built and maintained event-driven microservices using HTTP and RabbitMQ for interservice communication.
- Built a TypeScript tool to enable localization in embedded Qlik applications by generating translation variables deployed with the application skeleton, working around limitations of the standard translation system.
- Integrated AutoML resources into Qlik's data lineage platform by collecting and transforming service data, publishing and consuming update events, and implementing a Go API endpoint used by the lineage service to power frontend lineage views.

Creator, Software Engineer, SmoothSail  2023 – 2024

SmoothSail  is an open-source, self-hosted feature flag management tool. It enables developers to release features to targeted user groups to limit the impact of unforeseen bugs in production.

- Architected a self-hosted feature flag platform with an event-driven architecture using NATS JetStream, Express, PostgreSQL, and a custom SDK.
- Designed the database schema and backend APIs for feature flags, rulesets, and SDK keys, and implemented SDK authentication using Node.js Crypto.
- Built a real-time event distribution system using NATS JetStream to propagate feature flag updates reliably across application servers and SDK clients.
- Built a React and TypeScript admin dashboard for managing feature flags, rulesets, and application configuration.

SKILLS

Languages — TypeScript, Go, Java, JavaScript, Python

Backend — Spring Boot, Node.js, Express, REST APIs, GraphQL, RabbitMQ, NATS, Amazon SQS

Infrastructure/Observability — AWS, S3, Docker, Kubernetes, Splunk, SignalFX, Grafana, Argo CD

Databases — PostgreSQL, DynamoDB, MongoDB, Elasticsearch

Frontend — React, Next.js, TanStack Query

EDUCATION

Launch School, Software Engineering Program 2021 – 2023

California State University, Fullerton, Master of Music in Cello Performance 2018 – 2020
