SUMMARY

Software engineer with 3 years of experience building and maintaining distributed backend systems using Java, Go, and TypeScript. Experienced in improving high-traffic APIs, production reliability, CI pipelines, and service integrations, with end-to-end ownership across design, implementation, debugging, and cross-team delivery.

EXPERIENCE

Atlassian (Admin Experience team), Software Engineer 2025 – Aug 2026

- Reduced p95 latency by 34% on a Java/Spring Boot API serving ~5M requests/day by consolidating four sequential downstream calls into one, eliminating ~15M downstream requests per day; identified the optimization and owned the change end-to-end.
- Diagnosed an error-rate SLO breach causing ~20K failed requests per month by tracing requests across SignalFX and Sentry, verifying 99.985% success at the service layer and isolating the failures to invalid organization requests originating from the frontend.
- Reduced integration-test flakiness from ~50% to ~10% across ~700 tests and cut CI runtime from 8 to 6 minutes by diagnosing nondeterministic Elasticsearch behavior and restructuring the suite into isolated parallel batches.
- Identified and implemented an automated PR review workflow for external contributions, integrating an internal AI review tool into CI to catch recurring issues with error handling, feature gates, service migrations, and coding conventions before manual review.
- Enabled migration to a sharded architecture by auditing 10 downstream call sites, coordinating across teams to propagate missing site context, and implementing shard-aware request routing; deployed successfully without incidents.

Qlik (Qlik Predict), Software Engineer 2024 – 2025

- Maintained and operated ~10 production microservices handling ~50K requests/day and orchestrating asynchronous AutoML workloads, using RabbitMQ to coordinate model training, dataset creation, and job metadata across the platform.
- Built a TypeScript tool to enable localization in embedded Qlik applications by generating translation variables deployed with the application skeleton, working around limitations of the standard translation system.
- Integrated AutoML resources into Qlik's data lineage platform by building a Go API endpoint, transforming service data, and publishing/consuming update events; improved backend processing latency by restructuring six sequential service calls into three parallel execution groups.

SmoothSail 🗑️, *Creator, Software Engineer* 2023 – 2024

SmoothSail 🗑️ is an open-source, self-hosted feature flag management tool. It enables developers to release features to targeted user groups to limit the impact of unforeseen bugs in production.

- Architected a self-hosted feature flag platform with an event-driven architecture using NATS JetStream, Express, PostgreSQL, and a custom SDK.
- Designed the database schema and backend APIs for feature flags, rulesets, and SDK keys, and implemented SDK authentication using Node.js Crypto.
- Built a real-time event distribution system using NATS JetStream to propagate feature flag updates reliably across application servers and SDK clients.
- Built a React and TypeScript admin dashboard for managing feature flags, rulesets, and application configuration.

SKILLS

Languages — TypeScript, Go, Java, JavaScript, Python

Backend — Spring Boot, Node.js, Express, REST APIs, GraphQL, RabbitMQ, NATS, Amazon SQS

Infrastructure/Observability — AWS, S3, Docker, Kubernetes, Splunk, SignalFX, Grafana, Argo CD

Databases — PostgreSQL, DynamoDB, MongoDB, Elasticsearch

Frontend — React, Next.js, TanStack Query

EDUCATION

Launch School, Software Engineering Program 2021 – 2023

California State University, Fullerton, Master of Music in Cello Performance 2018 – 2020
