Experience

Atlassian Remote
Software Engineer (Admin Hub) *Jun 2025 – Aug 2026*

- Eliminated flakiness in 700 integration tests failing ~50% of runs by rewriting them to handle nondeterministic Elasticsearch behavior.
- Cut CI runtime from 8 to 6 minutes by running the integration tests in parallel batches.
- Restored the SLO on an AWS EC2 service by tracing failures to a frontend bug that sent 20K requests/month for nonexistent organizations.
- Cut latency 34% on a Java/Spring Boot API serving 5M requests/day by merging four downstream calls into one.
- Implemented a custom AI review Bitbucket Pipelines step flagging common issues in external PRs.
- Used Claude Code and Codex to assist with writing features and tests, debugging production issues, and reviewing PRs.
- Led the move of 10 call sites to a sharded downstream service across multiple teams.
- Created a React dashboard for dead-letter queue and API observability to help with prototyping and debugging.
- Mitigated production incidents while on call, and wrote onboarding guides and runbooks that helped teammates fix problems on their own.

Qlik Remote
Software Engineer (Qlik Predict) *Mar 2024 – Jun 2025*

- Led an AutoML reporting feature with product and design that unblocked enterprise customers who required model transparency.
- Cut latency 70% on a Go API endpoint by running six sequential service calls in parallel.
- Created a TypeScript tool to enable localization in 15 languages for embedded Qlik apps.
- Exposed AutoML resources to Qlik's data lineage platform by building a Go API endpoint and event integrations that powered its frontend lineage views.
- Owned 10 production services on AWS EKS serving 100K requests/day, with RabbitMQ running async AutoML jobs.

SmoothSail Remote
Creator, Software Engineer *Aug 2023 – Mar 2024*

Open-source, self-hosted feature flag management platform for limiting the impact of production releases.

- Designed a PostgreSQL schema for flags, user segments, and targeting rules, with all/any rule operators and reusable attributes, and built the Express REST API on top of it.
- Built a React/TypeScript admin dashboard for managing flags, targeting rules, SDK keys, and app configuration, plus a custom SDK that evaluates flags in client apps.
- Built SDK key auth that encrypted keys in transit and dropped all live SDK connections on key regeneration.
- Built real-time flag delivery over NATS JetStream and Server-Sent Events that re-sent the full ruleset on every change, so SDKs that missed an update couldn't serve stale flags.

Skills

Languages: TypeScript, Go, Python, Java, JavaScript, HTML, CSS
Frameworks & Libraries: React, Node.js, Express, Spring Boot, Next.js, TanStack Query, Bootstrap, Jest, JUnit
Databases & Messaging: PostgreSQL, DynamoDB, MongoDB, Elasticsearch, RabbitMQ, NATS
Cloud & DevOps: AWS (EKS, EC2, S3, SQS), Docker, Kubernetes, Argo CD, CI/CD, Sentry, SignalFX, Splunk, Grafana
Systems & Architecture: REST APIs, GraphQL, Microservices, Event-driven architecture
AI & Developer Tools: Claude Code, Codex, ChatGPT, MCP, GitHub Copilot, Git, GitHub, Bitbucket, Jira

Education

Launch School Remote
Software Engineering Program *2021 – 2023*

California State University, Fullerton Fullerton, CA
Master of Music in Cello Performance *2018 – 2020*
