EXPERIENCE

Atlassian, *Software Engineer (Admin Experience)* Jun 2025 – Aug 2026 | Remote

- Cut integration-test flakiness from ~50% to ~10% across 700 tests by fixing nondeterministic Elasticsearch behavior, and reduced CI runtime from 8 to 6 minutes by parallelizing the suite.
- Diagnosed an error-rate SLO breach affecting 20K requests/month, using Sentry and SignalFX to trace failures across frontend and backend services to requests for nonexistent organizations.
- Reduced latency by 34% on a Java/Spring Boot API serving 5M requests/day by consolidating four downstream calls into one, eliminating 15M requests/day.
- Integrated an AI code-review tool into CI to catch common issues in external contributions, and reviewed pull requests from internal and external contributors.
- Implemented shard-aware routing across 10 downstream call sites for a service migration, coordinating changes with multiple teams and deploying with no incidents.
- Wrote design docs, runbooks, and onboarding documentation that helped remote teammates ramp up and independently resolve production and on-call issues.

Qlik, *Software Engineer (Qlik Predict)* Mar 2024 – Jun 2025 | Remote

- Built a TypeScript tool that translated a business need, localization in embedded Qlik applications, into an automated deployment step that generates translation variables.
- Led development of a customer-facing AutoML reporting feature, collaborating with product and design to give users visibility into model training parameters and algorithms.
- Built a Go API endpoint and event integrations that exposed AutoML resources to Qlik's data lineage platform and powered frontend lineage views, then cut processing latency by parallelizing six sequential service calls.
- Maintained 10 production microservices handling 100K requests/day, using RabbitMQ to coordinate asynchronous AutoML workloads including model training and dataset creation.

SmoothSail, *Creator, Software Engineer* Aug 2023 – Mar 2024 | Remote

Open-source, self-hosted feature flag management platform for limiting the impact of production releases.

- Designed and built the system from scratch, including PostgreSQL schemas for feature flags and rulesets, Express REST APIs, and SDK authentication using Node.js Crypto.
- Built a real-time event distribution system with NATS JetStream that propagates flag updates to application servers and SDK clients.
- Built a React/TypeScript admin dashboard for managing feature flags, targeting rules, SDK keys, and application configuration, plus a custom SDK for evaluating flags in client applications.

SKILLS

Languages — Go, TypeScript, Python, Java, JavaScript, HTML, CSS
Frameworks & Libraries — React, Node.js, Express, Spring Boot, Next.js, TanStack Query, Bootstrap, Jest, JUnit
Databases & Storage — PostgreSQL, DynamoDB, MongoDB, Elasticsearch
Cloud & DevOps — AWS, Docker, Kubernetes, Argo CD, CI/CD, Sentry, SignalFX, Splunk, Grafana
Systems & Architecture — REST APIs, GraphQL, Microservices, Event-driven architecture, Distributed systems, RabbitMQ, NATS, Amazon SQS
AI & Developer Tools — Claude Code, Codex, ChatGPT, GitHub Copilot, Git, GitHub, Bitbucket, Jira

EDUCATION

Launch School, *Software Engineering Program* 2021 – 2023

California State University, Fullerton, *Master of Music in Cello Performance* 2018 – 2020
